

Modules

- an IntelliJ IDEA module
- a Maven project
- a Gradle source set (with the exception that the `test` source set can access the internal declarations of `main`)
- a set of files compiled with one invocation of the `<kotlinc>` Ant task

Visibility Modifiers

- **public** - visible everywhere
- `private` - visible just inside the class / file containing the declaration
- `internal` - visible in the same module (a compilation unit)
- `protected` - `private` + visible in subclasses
